CAPSTONE TITLE PROPOSAL FORM

Name of the Proponent/s:
Barros, Dizire
Labagala, Neriza Mae
Laureno, Nicole
Maiquez, Akira rio
Nacen, Viviene

Course: Bachelors of Science in Information Technology Date: August 5, 2025

1. 0 Proposed Capstone Title:

The Development and Implementation of Employee Management System for Citimotors Inc.

2.0 Area of Investigation

This study aims to develop and implement an Employee Management System designed specifically for CITIMOTORS INC. The system will offer a digital platform to manage and monitor various employee-related data and processes, including a dashboard overview, employee and applicant records, department listings, report generation, and 201 file storage. Additionally, the system will include an interview scheduling feature and SMTP-based email notifications to facilitate communication with applicants.

The system will be web-based and will centralize all employee data, allowing authorized personnel to easily access, update, or manage records. It is expected to reduce paperwork, eliminate redundant processes, and provide secure storage for sensitive employee information.

3.0 Reason for Choice of Study:

The researchers observed that CITIMOTORS INC currently lacks a centralized and automated system for managing employee and applicant records. The company's HR processes are mostly manual, prone to errors, and time-consuming. Searching for employee data, organizing applicant interviews, and generating reports take longer than necessary and often lead to inconsistencies. By digitizing these processes, the proposed system will address these challenges. It will offer a reliable, secure, and efficient platform that aligns with the company's growing operational needs.

4.0 Importance / Significance of the Study:

This system will significantly enhance the company's human resource operations. It will allow HR personnel to manage employee files, schedule interviews, and communicate with applicants in a more organized and timely manner. Reports can be generated quickly, aiding department heads and management in making data-driven decisions.

Moreover, storing and updating employee 201 files digitally ensures proper documentation and prevents loss or damage of physical records. With built-in email notifications, the company can maintain clear communication with job applicants and employees.

5.0 Target Beneficiaries:

The target beneficiaries of this study will be the entire management and operational staff of CITIMOTORS INC, particularly those involved in employee supervision, recruitment, and administrative processes. The company is organized into several core divisions: Human Resources, Department Heads, and Administrative Support. With a comprehensive employee management system, CITIMOTORS INC's operations will run more efficiently and securely, as detailed below:

The first division – Human Resources Division – Responsible for managing employee records, applicant screening, interview scheduling, and personnel documentation. With the system in place, HR personnel will have a centralized platform to store 201 files, schedule applicant interviews, and automate email communication, significantly reducing manual workload and human error.

The second division – Department Heads – Supervise teams and monitor employee performance across various units. Through the system, they will gain quick access to employee data, departmental assignments, and reporting tools that assist in staff allocation, project planning, and evaluating manpower needs.

The third division – Administrative Support Division – Handles clerical work, internal communications, and document management. With the new system, administrative staff will benefit from organized digital records, searchable databases, and automated notifications that make day-to-day operations more streamlined and secure.

6.0 Similarities with any Previous Study / Project / System (at least (3))

According to Delos Santos-Suñga and Moreno (2024) in their study entitled "Evaluating the Effectiveness of Human Resource Information Systems in Enhancing Administrative Efficiency: A Case Study of Zamboanga City Local Government," the implementation of an HRIS significantly improved administrative processes such as payroll, onboarding, and data accuracy. This is similar to the proposed system for Citimotors Inc, which also aims to reduce delays and errors in employee management through automated workflows, centralized data storage, and integrated reporting features.

According to Barayuga et al. (2024) in their research "Employee Performance Data Management and Analysis of HRIS at Ilocos Sur Polytechnic State College," the HRIS developed was capable of managing employee 201 files, generating analytical reports, and supporting HR decisions. This is aligned with the proposed system's modules, which include comprehensive employee information management, department records, and real-time performance tracking.

According to Durai and Keetticka (2017) in their paper "Applicant Tracking System (ATS): A Component of HRIS – Benefits and Issues in Its Usage," the use of ATS allowed automation in recruitment processes, such as resume screening, interview scheduling, and email notifications. These features are also present in the proposed system through its SMTP-based email functionality and interview scheduling module, showing a direct similarity in functionality and objective.
